PRISM.Sharpen Quickstart Guide

1. Add the Prism Sharpen component to your main camera
2. Adjust the "Sharpen Amount" slider to change the amount of sharpening your image receives
3. That's it!

In-Depth: Types of Sharpen

- Standard
  Standard sharpen is the core sharpening effect from PRISM. using a luminance based technique, standard sharpen is a good all-round sharpening effect at a very low performance cost.
- Photographic
  Photographic sharpen uses a more advanced median technique found in many common photographic programs, and adjusted for real-time use. This technique makes textures super crisp, but is more expensive than Standard sharpen, and doesn't play as well with noise
  Not recommended for mobile
- Photographic Fast
  The same as Photographic, but about 30% faster, for lower end platforms.
  Only recommended for very new phones.
